

# Adjustment of LDS laser diode

## Overview

A popular approach to stabilize the output intensity is to first convert the photodiode current to voltage. This voltage can then be read by a microcontroller, where logic can be programmed to adjust the current supplied to the laser diode. This method is illustrated in. ROHM offers laser diodes (LDs) for Light Detection and Ranging (LiDAR). This application note will introduce ROHM's LD line-up and show how to design the drive circuits of ROHM LDs. Once known, the next set of choices revolves around mounting a laser diode and choosing the appropriate drivers, regulators, and choosing the placement of the diode within the lab. The example when 30mA is injected to LD on graph1 is as follows. If  $T_c$  is 60 degrees,  $P_o$  might be about 1mW.

## Adjustment of LDS laser diode

SLDs, however, are prone to pathological drifts, such as temperature variations and mode-hopping, that can alter the output intensity. A popular approach to stabilize the output intensity ...

This test load may be a short circuit or a fast Schottky diode like MBR0540. Please connect the test load only between anode and cathode (LD+ and LD-) and prevent shorts to any other part of the circuit.
