

Introduction to Fiber Optic Pigtail Technology

Overview

Fiber optic pigtails are short, single, or multi-strand pieces of optical fiber cables with a connector on one end and exposed fiber on the other end. They are typically used to terminate fiber optic cables and connect them to patch panels, equipment, or other termination points. Get the wrong connector type, the wrong polish, or skip proper fusion splicing technique—and you're looking at elevated signal loss, increased back reflection, and a. Fiber pigtails are simple in appearance, yet essential in function. By combining factory-installed connectors with spliced bare fiber, pigtails ensure that network installers can create. A fiber optic pigtail is actually the end of a fiber optic cable with fiber optic connectors on both sides of the cable only, leaving no connectors on the other side so that the connector side can come from the device and the other side can be fused together with the fibers of the optical cable. Compared with quick termination or epoxy and polish connections placed on the field.
