

Is a slotted optocoupler a type of optocoupler

Overview

The device shown in Figure 3 is known as a slotted optocoupler, and has a slot molded into the package between the LED light source and the phototransistor light sensor. Figure 1 shows the basic form of such a device. With an optocoupler, the only contact between the. Optocouplers, also known as opto-isolators, uses infrared light to transfer electrical signals between two electrically isolated circuits and are commonly classified by their photosensitive output device What is an Optocoupler?

An optocoupler (also called an opto-isolator, photo-coupler, or optical. An opto-isolator (also called an optocoupler, photocoupler, or optical isolator) is an electronic component that transfers electrical signals between two isolated circuits by using light. Opto-isolators prevent high voltages from affecting the system receiving the signal. Unlike transformers or capacitors, which can only transfer AC signals across the isolation barrier, optocouplers can.
