The switch first shuts down low-priority devices. If the switch still lacks enough power, it shuts down high-priority devices in descending order of port number.

The switch cannot provide enough power to each port, so it provides power according to the priority. The administrator sets the priority for each port, allocating how much power it can be given.

Assigns a power priority of low (the default), high, or critical to each enabled PoE port. A lower-numbered port has priority over a higher-numbered port within the same configured priority class, for ...

When the total power requested by the PDs exceeds the total PoE power budget on the switch, you can set the PD priority to allow the switch to provide power to ports with higher priority first.

Reconfigures the PoE priority level on <port-list>. For a given level, ports are prioritized by port number in ascending order. For example, if ports A1-A24 have a priority level of critical, port A1 has priority ...

See Switch priority class on page 19 for information on the use of PoE port priority classifications. Within each priority class, a lower numbered port is supplied power before a higher numbered port.

The priority determines the order in which PoE is removed from ports if a power shortage occurs: low-priority, then high-priority, with power maintained for critical-priority ports as long as ...
