

Protecting optical cables in pipelines

More durable and robust

The outer layer is made of environmentally friendly PVC, which is soft and elastic. It can be stretched without damage, so you can use it with confidence.

Overview

Distributed acoustic sensing (DAS) is a fiber-optic sensing method that can protect large swaths of oil and gas pipeline while leaving a small footprint. DAS can help against critical oil and gas infrastructure threats such as unplanned activities, user errors and environmental vibrations in the vicinity of the pipeline. DAS can also be used to detect the subtle vibrations very near to the pipeline that result from product. This innovative material offers unparalleled protection for special pipes and underwater cables against impact and abrasion. In addition, we have also created a protective sheath for underwater cables and have successfully manufactured and supplied products that meet the unique requirements of. Uraduct® is a cable protection system designed and developed to protect subsea: fiber optic cables, power cables, umbilicals, flexible flowlines, rigid flowlines, hoses and bundled products from abrasion and impact. Uraduct® can also be used to add ballast to cables and flowlines. These fibers enable SCADA (Supervisory Control and Data Acquisition) functionality, allowing operators to detect leaks, stress, temperature changes, and. Distributed fiber optic sensing (DFOS) techniques such as Distributed Strain Sensing (DSS), Distributed Acoustic Sensing (DAS)

and Distributed Temperature Sensing (DTS) are powerful tools for continuous monitoring of large assets.

Protecting optical cables in pipelines

Protectorshell Split Pipe is a cable protection system developed to provide shallow water abrasion and impact protection for fiber optic cables, subsea cables (submarine cables) and offshore wind cables.

Read the full BBC article here to learn how fiber optic sensing is reshaping subsea cable protection. Subsea cables and pipelines are the hidden arteries of our modern world—supporting ...

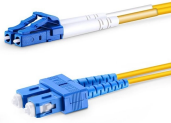

Yet, some challenges arise when trying to install fiber optic cabling on the pipeline. CCI Inc. decided to look at some of these challenges and develop a solution to help protect the cabling.

Tight buffered and loose tube cables are the most common configurations used for organizing and protecting optical fibers inside the cable core. This helps keeping fiber attenuation low and ensures ...

Learn how Polywater® ZipSeal™ protects fiber optic conduit in gas transmission projects by blocking rodents, insects, and moisture with fast installation.

All three of the distributed fiber optic sensing technologies can be used in monitoring pipelines, as each provides unique insight into the operational characteristics and environmental conditions of the pipeline.

Solution developed by Panduit, is a cost-effective and efficient protecting subsea pipes and cables from abrasions and installation and operation.

Distributed acoustic sensing (DAS) is a fiber-optic sensing method that can protect large swaths of oil and gas pipeline while leaving a small footprint. DAS can help against critical oil and ...

Uraduct® is a cable protection system designed and developed to protect subsea: fiber optic cables, power cables, umbilicals, flexible flowlines, rigid flowlines, hoses and bundled products from abrasion ...

Whether it's fibre optic cables, power cables, umbilicals, or flexible and rigid flowlines, Uraduct® has you covered. If you've ever considered the challenges of subsea engineering, you ...
