

# The secondary distribution box is an enclosed distribution box

## Overview

The Secondary Distribution Box (SDB) receives power from Main Power Distribution box via an extender cable and provides a central power distribution to feed normal branch circuits to the electric floor modules through snap-on extender cables. Whether you're working on a residential building, a commercial facility, or a large industrial plant, understanding the. Step-down transformers (distribution substation transformers) are used in distribution substations to reduce sub-transmission voltages to principal distribution voltages in the 2.2 kV to 46 kV range for local distribution. secondary unit substation is a close-coupled assembly consisting of enclosed primary high voltage equipment, three-phase power transformers, and enclosed secondary low-voltage equipment. Let's make an example for clarity: A newly constructed residential area introduces a 10kV power line to a substation.
