

What is an OIO optical module

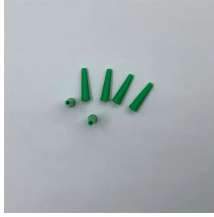

Overview

What exactly is integrated Optical I/O (OIO)?

OIO refers to chiplet-based optical interconnect technology that integrates directly with the computing chips (CPUs, GPUs, xPUs, ASICs, etc.) and utilizes the die-to-die (D2D) lower speed, higher radix connectivity. They provide board-to-board and rack-to-rack level connectivity and are used to easily insert and remove a fiber optic cable from a board faceplate, providing a connection between the electrical interconnects inside the board and optical fiber outside the board. Another benefit of pluggable optics. Silicon Photonics: Silicon photonics is a technology process that combines optical components with silicon-based electronics to create integrated circuits (ICs) that transmit and process data using light. Our commitment is to provide EDA solutions that expedite the specialty semiconductor design process. © 2025 Latitude Design Systems PTE.
