

What is the function of a power distribution box in Tuvalu

Overview

A power distribution box works like a traffic controller for electricity. It takes in power from the main supply and sends it out to different areas or devices through separate circuits. The Tuvalu Electricity Corporation (TEC) wishes to inform all residents that temporary power shedding will be implemented across affected areas due to a shortfall in available generation capacity. It is responsible for transmitting electrical energy from the power station to various electrical equipment. In this article, we will explain in detail how it works. Distribution substations connect to the transmission system and lower the transmission voltage to medium voltage ranging between 2 kV and 33 kV. At the heart of this network lies a power distribution box, the component responsible for dividing and controlling electricity as it moves from the main source to multiple end-use circuits.
