

Wiring method for an 8-channel optocoupler module

Overview

This tutorial gives an introduction to the HY-M154 / 817 optocoupler module. An optocoupler (also called an opto-isolator or photocoupler) is a component that transfers an electrical signal between two isolated circuits using light. Because the signal crosses as light —. The 12V 8-Channel Relay Module with Optocoupler is designed to control multiple high-voltage devices using low-voltage signals from microcontrollers like Arduino, Raspberry Pi, and ESP32. In electric circuits, we use mostly filters to remove noise. The circuit based on the capacitor and resistor always removes the noise from the incoming signal but the value capacitor and resistor always depend on the. 1>. Jumper Cap Can Achieve Output Port Is High POtential Or Pull Down Output.
